

Industrial Hygiene

Whether your business is currently providing essential services or poised to reopen once the pandemic subsides, Wood is helping businesses and communities navigate the challenge of creating a safe environment for employees and facility occupants.

Safe operations

The escalating crisis has placed a renewed focus on developing health and safety protocols and guidance for facilities related to COVID-19 and future pandemics.

Our team of industrial hygienists, safety specialists, risk assessors, and toxicologists are developing customer tailored guidelines and response plans for facilities to reduce exposure risk, keep essential operations running with minimal interruption, and prepare protocols to safely reopen.

Creating a new normal

Health and safety policies and procedures will be forever changed as a result of the global pandemic. As businesses begin reopening, many are facing the challenge of determining what the new normal will look like. For example, how do retail businesses safely take back returns or allow customers to try on clothing they do not buy? What will seating look like in sports arenas? How does a restaurant ensure the safety of patrons in their dining room?

Wood is helping businesses answer these questions and more. We are partnering with clients to develop policies to address performing day to day functions while maintaining safe distance guidelines and

performing increased surface cleaning protocols. Because ensuring patrons feel safe to shop, sleep, eat and work in establishments across the country is essential to achieving sustainable recovery.

Protecting our communities and supporting our customers

Our industrial hygiene expertise:

- Pandemic response plans
- Facility cleaning and remediation protocols
- Job hazard analysis
- Health and safety plans, including direction on bloodborne pathogens and hazardous communications
- Third-party review and expert opinion
- Quality assurance
- Occupational health & safety plans

Industrial Hygiene (continued)

Lending a helping hand

With information changing daily – sometimes hourly – our experts stay on top of the latest guidance from authorities such as the World Health Organization (WHO) and other global and national health advisors to make sure the latest guidance is incorporated into facility safety plans.

Our most recent work includes:

- Providing health and hygiene guidance to financial institutions to keep patrons and employees safe
- Supporting the safety of essential health workers by reviewing COVID-19 inhalation hazards and conducting fit testing of N-95 respirators at hospitals
- Protecting public safety with COVID-19 guidance at a solid waste facility in hard-hit Seattle to make sure transfer station facilities are cleaned to the highest standards
- Reviewing job hazard analysis for a local public transportation entity
- Installing a station cleaning tracking software system to track cleaning of each work zone/station for a company's North American vehicle assembly operations
